

# Understanding physical activity and trajectories of health among children with autism spectrum disorder, ages 2 - 5

\$280  
incentive

By understanding the relationship among physical activity, motor skill competence, physical fitness and weight status, this research study will help us to develop effective interventions that will promote physical activity and health for children with ASD. To better understand development, all assessments will occur 6 times (across 2 years).

We are looking for children between the ages of 2 and 5 years old with ASD
